Symfony checkpoint - One day

Hi dude, for this last WCS's checkpoint, you'll have to create an entire project about cooking recipes, like the best known, Marmiton !
This one is composed of main features which are very useful for grandmas :D !
You have the whole day to do that, so don't be stressed and keep calm.

1/ Main instructions

You have to create a website which proposes some functionalities, such as adding recipes, listing them, deleting them, selecting only one containing all the necessary ingredients according to the number of people, searching a targeted recipe not just with his own name, listing random recipes on the home page.

We'll look your ability to create and manage features that are not listed above. These must be relevant for your website. Base yourself on popular recipe websites just like Marmiton or AllRecipes.com.

In this checkpoint you should use almost all Symfony tools like creating entities with relationships, CRUDs, forms, services, routes, fixtures, an algorithm for relevant searches, and calculating the right portions.

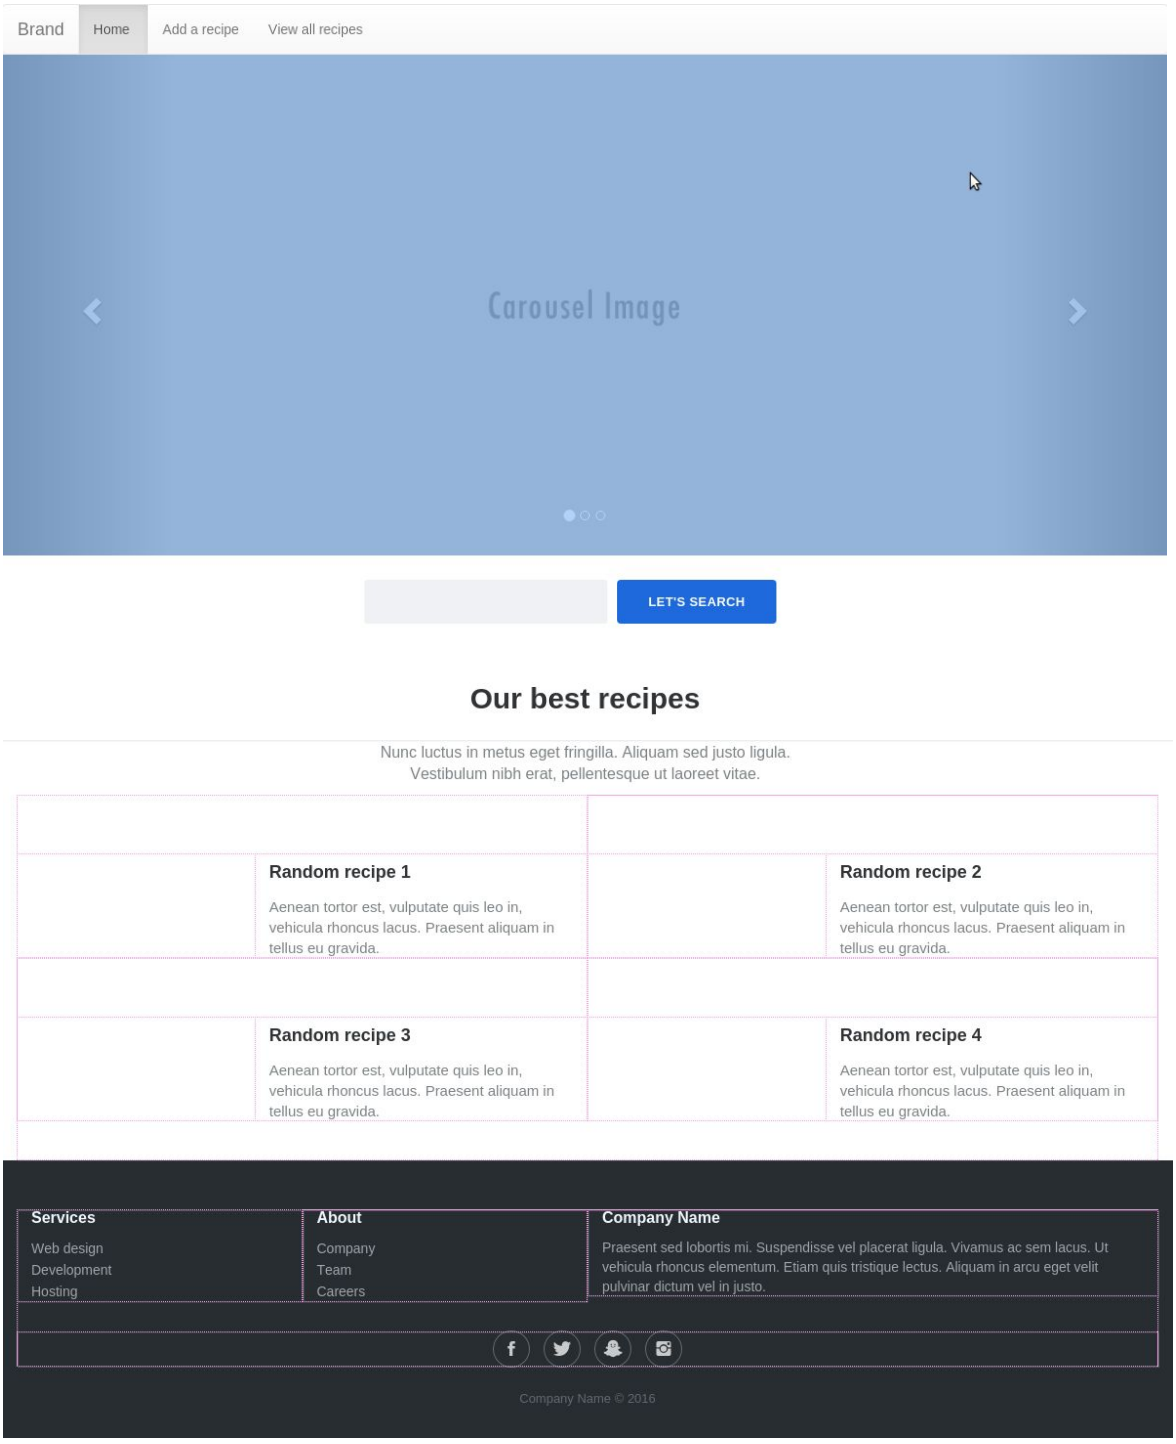
2/ Indications

The correction will focus on the main points, not just on the functionalities, so think about your project design before developing your website.
Precisely on your entities relationship, on the structure and model design, the quality of the research, ergonomics, user interaction and so on.

Your code must be clean, go along with PHP / Symfony standards, have clear variable names and be commented.
The project must be **functional.** Get to the essential points right away.

To push your result, just add a new branch in this repository with [FIRSTNAME]_[LASTNAME] and do a pull request.

To conclude, regarding the templates twig, do not waste time on the quality of the visual. A rendering as below is enough :



YOU'VE PUTIN A LOT OF WORK
GOODLUCK.
